

ANTIHERO GUIDE • ZERO TO \$20K

THE ULTIMATE ANTIHERO WEBSITE MASTERCLASS

Build a premium, animated website by talking to your AI. Research it, collect references, speak the stack, build it one section at a time, and put it online. You do not need to code.

GOOGLE ANTIGRAVITY • GEMINI • GROK • NOTEBOOKLM • HOSTINGER

CONTENTS

01 GIVE YOUR AI APPS

MCP servers and skills, and the safety check before any install.

02 RESEARCH AND AI SEO

NotebookLM builds your plan, your stack, and your prompts.

03 COLLECT REFERENCES AND FONTS

Context engineering: sites, screenshots, fonts, and one folder.

04 SPEAK THE STACK

The keywords that make the result look expensive.

05 BUILD THE HERO FIRST

One section at a time, starting with a video splash page.

06 SEE IT, FIX IT, MAKE IT MOBILE

Preview locally, fix with screenshots, then make it work on phones.

07 THE POLISH LAYER

White space, fades, scroll motion, glow, and sound.

08 BLOG AND SCHEMA

Get found by Google and by AI search.

09 GO LIVE WITH HOSTINGER

Domain, hosting, API token, deploy.

LR LINKS AND RESOURCES

AS ACTION STEPS

IF YOU CAN TALK, YOU CAN BUILD

This guide takes you from nothing to a live, premium website. You will not write code. You will describe what you want, show your AI examples, and correct it until the site looks right.

Work through the steps in order. Each one ends with something done. The copy-paste prompts are in the grey boxes. Swap in your own business, fonts, and files.

It costs nothing to start. You do not need a domain or hosting until the last step, and an old computer is fine, because most of the work happens in the cloud.

WHAT YOU NEED

ANY COMPUTER	A 2017 machine works. Speed does not matter much.
GOOGLE ANTIGRAVITY	Your AI coding workspace. It has a free version.
GEMINI	The model you build with inside AntiGravity.
NOTEBOOKLM	Free research tool from Google.
GROK	For the hero video. Runway or Midjourney also work.
HOSTINGER	Domain and hosting, only when you are ready to go live.

GIVE YOUR AI APPS

Your phone has apps that make it more useful. MCP (Model Context Protocol) does the same for your AI. Think of your AI as a brilliant brain in a glass jar. MCP gives it hands.

- 1 Start with the official list.** Browse the MCP servers repository and the Figma MCP (links on the Links and Resources page). Pick only what helps you build a website.
- 2 Find skills.** Search X for "AntiGravity Skills". Skills are add-ons that make AntiGravity better at specific jobs.
- 3 Let your AI install them.** Paste the link or list into AntiGravity and ask it to install everything for you. Talk to it out loud if typing slows you down.
- 4 Run the safety check first, every time.** Some packages hide bad instructions. Paste this before any install:

I want to install the MCP repository from this link. Before I do, please read through the code, check it for security vulnerabilities, verify its reputation score, and tell me if it is completely safe to install.
- 5 Treat it like a teammate.** Say please and thank you, and talk to it like a friend. The answers get better when the conversation is clear and calm.

"MCP just connects it to stuff."

RULE Never install random scripts blindly. If you did not run the safety check, do not install it.

MCP SERVERS

FIGMA MCP

ANTIGRAVITY SKILLS

RESEARCH FIRST

Every AI likes to be talked to differently. Before you build, have NotebookLM research your niche and write the exact prompts for your coding AI.

- 1 **Open NotebookLM and choose deep research.** Not fast research. Deep research pulls from many sources at once and costs nothing.
- 2 **Paste the research prompt.** Change the business to yours:

```
I am building a website for a high-end physical construction company. Research the best, fastest, and most modern programming stack to build this today. Create a comprehensive, step-by-step website architecture plan. Then, write out the exact, highly-detailed prompts I need to copy and paste into my coding AI (Google AntiGravity) to execute it. Ensure the entire structure is fully optimized for both traditional Google SEO and modern AI Search Engines (Siri, ChatGPT, Perplexity, etc.).
```
- 3 **Ask for a prompting report.** Create a report on how to prompt your model for your landing page, for example: how to prompt Gemini to build a stunning landing page for your project, with a video on the splash page.
- 4 **Keep the report.** You will paste it into AntiGravity as context in Step 5. You do not need to understand every line of it.
- 5 **Use it for anything else you need to learn.** NotebookLM also makes slide decks, mind maps, flashcards, and video overviews.

"So they like to be talked to differently."

WHY Plan for AI search from day one. The research prompt asks for Google SEO and AI search engines together.

TOOLS

NOTEBOOKLM

DEEP RESEARCH

FIND WHAT YOU LOVE

You do not need to be a designer. You need to be good at finding sources and showing your AI exactly what you like. That is context engineering.

- 1 **Browse the galleries.** Aura Build, Awwwards (strong on GSAP motion), Behance, Godly, Lapa Ninja, and Siteinspire.
- 2 **Pick 3 to 5 sites.** Not 20. Too much context confuses the model, the same way 30 instructions would confuse a person.
- 3 **Screenshot the sections you like.** Put every screenshot in one folder, with a note on each: what you like and why. Links help too, because your AI can read a site's code.
- 4 **Choose 2 fonts.** One for headers from Fontshare, one for body text from Google Fonts. Font Squirrel and Typewolf are good for browsing.
- 5 **Drag the folder into AntiGravity and paste:**

```
I have attached visual references of websites I absolutely love. I want you to build me a site with a similar premium vibe, structure, and aesthetic, but make it completely unique to my brand. Use [Insert Fontshare Font Name] for all the big headers and [Insert Google Font Name] for the body text.
```

"You just need to find websites that you really love."

CREDIT If you build off someone's design, credit them at the bottom of your site with a link. You do not need to steal anything.

SPEAK THE STACK

You do not need to know what these tools do. Naming them in your prompt gets you a more polished, faster site.

1 Learn the words. **Astro** is the framework. **Vanilla JS** handles logic. **Node.js** runs it. **GSAP** animates. **Lenis** smooths scrolling. **Framer Motion** brings elements in nicely. **Three.js** renders 3D, often with **GLB** model files.

2 Load the stack in your first build prompt.

Build this website using Astro for the framework and Vanilla JS for the logic. I want the site to feel incredibly premium and expensive, so you MUST use GSAP for all entrance animations and Lenis for buttery-smooth scrolling.

3 Add 3D only if it fits your brand. Attach a GLB model, or ask your AI to find open-source GLB models online, then paste:

Embed the attached GLB model on the page using Three.js. Make the 3D object float gently and rotate slowly based on the user's mouse movement across the screen.

"You're gonna get a more polished project"

NOTE 3D is heavier to run. Start without it if you want the first build to go smoothly.

GSAP

LENIS

FRAMER MOTION

THREE.JS

GLB

BUILD THE HERO FIRST

Do not build the whole site in one prompt. Build the hero section, get it right, then move to the next section.

- 1 Make a background video.** Take a photo of your work. Ask AntiGravity to write a Grok prompt that turns it into a dramatic, realistic video loop, and say what it is for and why. Generate it in Grok (Runway or Midjourney also work) and download it.
- 2 Open a fresh chat.** Attach your research report, reference folder, fonts, and the video. If a file will not attach, right-click it, choose Copy as path, and paste the path.
- 3 Say the emotion.** Tell it what visitors should feel: quality, trust, calm. Tell it the business name and location too, or it will make one up.
- 4 Ask for the hero only, plus navigation.**

Use this video file as the looping background for the hero section.

Add: build a menu, no AI slop, keep it contemporary and elegant, and make it good enough for Awwwards.
- 5 Perfect it before moving on.** Then ask for the next section, and the next. Remind it to keep using the earlier context.

"You just wanna do it in small sections."

WHY Overloading the AI is the most common mistake. Small asks get better results.

TOOLS

GROK

RUNWAY

MIDJOURNEY

GOOGLE ANTIGRAVITY

SEE IT. FIX IT.

The first pass will be close and a little wrong. Show your AI what is wrong, ask plainly, and reload.

- 1 Preview it.** Ask AntiGravity to start the development server and open the page, and to double-check that it is its best work first.
- 2 Know what localhost means.** The site is running only on your computer. Anyone you send that link to will not be able to open it.
- 3 Fix with screenshots.** Screenshot the problem, drag it into the chat, and describe it: overlapping words, wrong name, a photo you do not like. Ask for 1 or 2 changes at a time.
- 4 Reload properly.** Hold Shift and reload to see the latest version.
- 5 Make it mobile.** Mobile is not optional. Paste:

```
Review the code you just wrote. Make sure this entire website is perfectly responsive and optimized for mobile devices (iOS and Android). Ensure all GSAP animations and Lenis scrolling effects perform flawlessly on a phone screen without causing lag or breaking the layout.
```

"It doesn't have to be perfect."

IF IT GETS CONFUSED Too much context can make it repeat itself. Remove some, start a new chat with the same prompt, and go one item at a time.

TOOLS

LOCALHOST

SCREENSHOTS

THE POLISH LAYER

Small effects make a site feel premium. Ask for them, look at the result, then ask for less.

- 1 Add white space.** Ask for substantially more white space. It is the fastest upgrade there is.
- 2 Blend the video.** Ask for a smooth fade from the hero video into the next section with no visible line. If the fade covers your text, make it shorter.
- 3 Add motion.** A marquee scroller, a video driven by scrolling, headlines that come in from different angles as you scroll, and a horizontal GSAP scroll.
- 4 Add hover glow and texture.** A warm, slow WebGL glow on titles when the mouse passes over them. Subtle background tracers. A light noise overlay, then tone it down or remove it if it is too much.
- 5 Steal an effect, politely.** Paste the page link and say: on this website, I like this section, I want mine to move like this.
- 6 Add optional sound.** Download a track from Pixabay Music, then paste:

Add an elegant, minimal play button in the bottom corner of the site that triggers this ambient audio track. It MUST start paused by default so it doesn't annoy the user, but it should fade in smoothly when they click play.

"These are small effects."

DIAL BACK If an effect draws attention to itself, it is too strong. Ask your AI to halve it.

BLOG AND SCHEMA

A beautiful website is nothing if nobody sees it. A blog brings people in, and Schema markup helps search engines and AI bots understand every page.

- 1 Add the blog.**
Add a highly SEO-optimized blog directory to the site so I can drive organic traffic. Ensure every single article page uses standard Schema.org markup so Google's web crawlers and modern AI bots understand the content perfectly and rank it higher.
- 2 Use your research.** Your NotebookLM report from Step 2 already covers Google SEO and AI search. Paste the relevant part in with the prompt.
- 3 Say it upfront next time.** If you forgot to ask for SEO in the first build, add it now. On your next site, put "SEO optimized" in the first prompt.
- 4 Check the markup.** Schema.org is the standard vocabulary your AI uses. Ask it to confirm every article page has it.

"A beautiful website is nothing if nobody sees it."

THINK OF IT THIS WAY A site with no traffic is a digital billboard in the middle of the desert.

SCHEMA.ORG

NOTEBOOKLM

GO LIVE

Build locally until you are happy. Then get a domain and hosting and let your AI deploy the site for you.

- 1 Set up Hostinger.** Create an account (you can sign in with Google), choose a hosting plan, then go to Domains and get a new domain.
- 2 Create an API token.** In hPanel, open Dev Tools, then API, then Generate Token. Give it a name and an expiry, click Generate, and copy it immediately.
- 3 Store the token safely.** Hostinger shows it only once. Treat it like a password and never post it anywhere.
- 4 Deploy.**

I am ready to deploy this website to the internet. Here is my Hostinger API Token: [Paste Your Token Here]. Please use the Hostinger API to package up this local website and deploy it directly to my live server.
- 5 Check the live site on your phone.** Then share the real link, not localhost.

"You can literally just get a domain."

SECURITY If a token leaks, delete it in hPanel and generate a new one.

KEY TAKEAWAYS

- 1 If you can talk, you can build.** No code, no domain, and no new computer to start.
- 2 Research first.** Let NotebookLM write your plan and your prompts, with SEO and AI search built in.
- 3 Context beats guessing.** 3 to 5 reference sites, screenshots in one folder, and 2 fonts.
- 4 Speak the stack.** Astro, Vanilla JS, GSAP, and Lenis in the prompt get you a more polished site.
- 5 One section at a time.** Hero first. Perfect it, then move on.
- 6 Fix with screenshots.** Show it what is wrong, ask for 1 or 2 changes, and reload.
- 7 Mobile is not optional.** Run the mobile prompt before you go live.
- 8 Check before you install.** Every MCP and skill gets the safety prompt first.
- 9 Get seen.** A blog with Schema markup, then deploy through the Hostinger API.

TOOLS

GOOGLE ANTIGRAVITY	AI coding workspace where you build the site. Free version available.
GEMINI	The model you build with.
NOTEBOOKLM	Deep research, architecture plan, and the prompts for AntiGravity.
GROK / RUNWAY / MIDJOURNEY	Turn a photo into a looping hero video.
MCP SERVERS / FIGMA MCP	Apps that connect your AI to other tools.
AURA BUILD / AWWWARDS / GODLY	Galleries of premium sites to reference.
BEHANCE / LAPA NINJA / SITEINSPIRE	More design references.
FONTSHARE / GOOGLE FONTS	Header and body fonts.
FONT SQUIRREL / TYPEWOLF	More places to browse fonts.
ASTRO / VANILLA JS / NODE.JS	Framework, logic, and runtime keywords for the build prompt.
GSAP / LENIS / FRAMER MOTION	Animation, smooth scrolling, and entrance effects.
THREE.JS / GLB	3D objects and effects.
PIXABAY MUSIC	Ambient audio for an optional play button.
SCHEMA.ORG	Markup that helps Google and AI bots understand your pages.
HOSTINGER	Domain, hosting, and API deploy.

ACTION STEPS

-
- ☐ 01 **INSTALL YOUR AI APPS, SAFELY**
Browse MCP servers and AntiGravity Skills. Run the safety prompt before each install.

 - ☐ 02 **RUN NOTEBOOKLM DEEP RESEARCH**
Paste the research prompt with your business. Save the plan, the prompts, and a prompting report.

 - ☐ 03 **BUILD YOUR REFERENCE FOLDER**
3 to 5 sites, screenshots of the sections you like, a note on each, and 2 fonts.

 - ☐ 04 **MAKE YOUR HERO VIDEO**
Have your AI write the Grok prompt from one of your photos. Generate it and download it.

 - ☐ 05 **PROMPT THE HERO SECTION ONLY**
Fresh chat. Stack loader, references, video, emotion, name, and location.

 - ☐ 06 **FIX WITH SCREENSHOTS**
Preview on localhost. 1 or 2 changes at a time. Shift and reload.

 - ☐ 07 **POLISH, THEN DIAL BACK**
White space, fades, scroll motion, and glow. Halve anything that shouts.

 - ☐ 08 **MAKE IT MOBILE**
Run the mobile prompt and check it on your phone.

 - ☐ 09 **ADD THE BLOG AND SCHEMA**
Run the blog prompt so search engines and AI bots can read every article.

 - ☐ 10 **GO LIVE**
Domain, hosting, API token copied once, deploy prompt. Share the real link.

POST WHAT YOU BUILD IN THE GROUP BE YOUR OWN HERO

Share your site, your fixes, and your questions, even months from now. The crew learns faster when you build in public.
